

International Institute for Carbon-Neutral Energy Research

Electrochemical Energy Conversion Revised Roadmap

March 2019

KYUSHU UNIVERSITY

A World Premier Institute

I ILLINOIS

Division Objective

This division conducts fundamental studies on the two essential components for electrochemical energy conversion: electrodes and electrolytes

- To understand and tailor the chemistry of surfaces, interfaces and the intrinsic nature of electrodes
- To comprehend, control and design ion conduction in electrolytes

Technological development for energy-efficient and robust electrochemical energy conversion is pursued to enable fundamental electrode and electrolyte studies for:

- Polymer electrolyte cells
- Solid oxide cells
- Energy storage

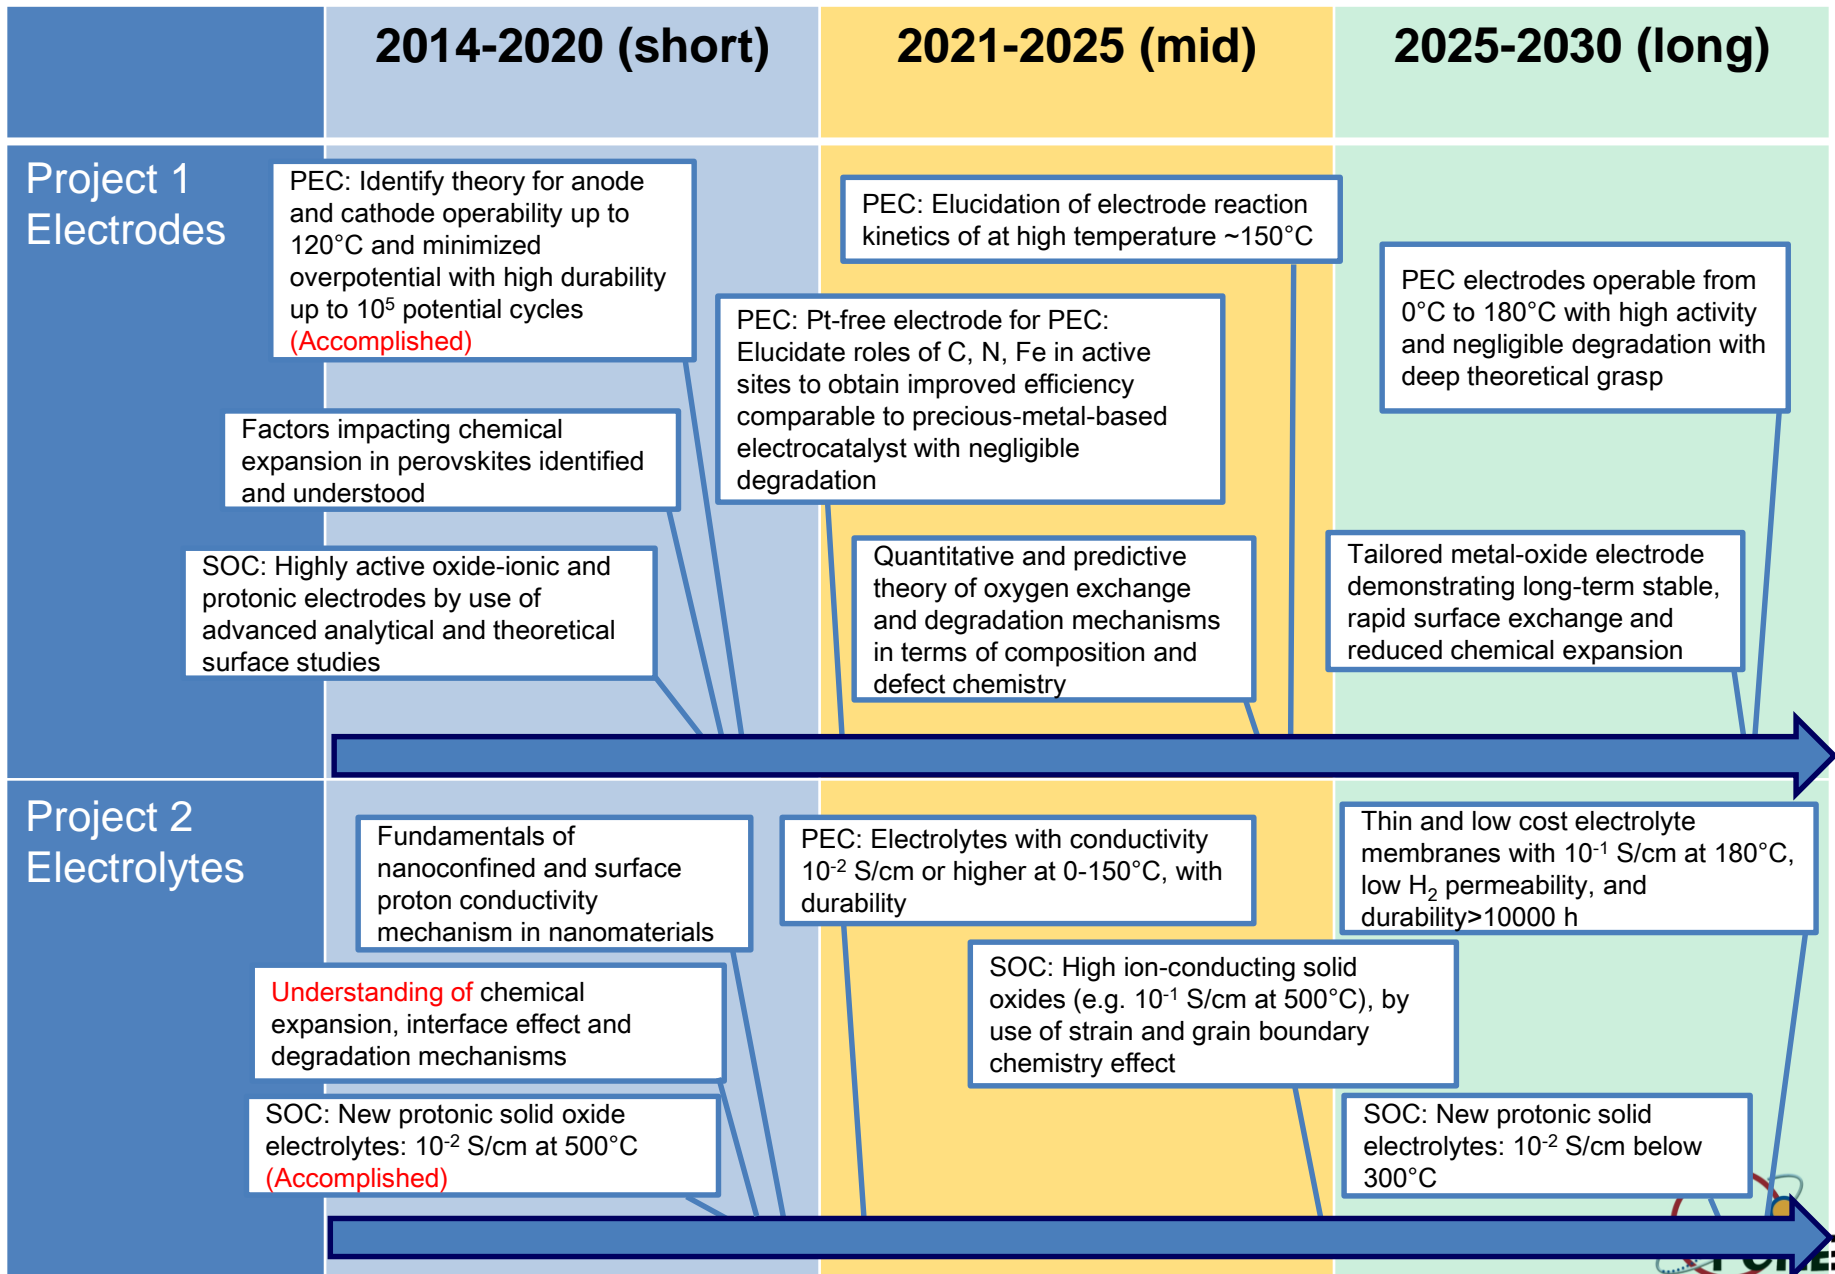

Division Projects, Objectives, and Research Efforts (1)

Projects	Objectives	Research Efforts	Researchers
Project 1 Electrodes	<p>Understanding and tailoring the chemistry of surfaces, interfaces and the intrinsic nature of electrode materials.</p> <ul style="list-style-type: none"> • Elucidating fundamental processes in electrochemical reactions and electrode degradation phenomena. • Use of these insights to design novel, more efficient, durable electrode materials for polymer electrolyte cells (PECs) and solid oxide cells (SOCs). 	<ul style="list-style-type: none"> • Investigation of Pt-free Fe/N/C electrocatalysts for PECs. • Design of functional materials and layered structure for enhanced use in PEC electrodes. • Advanced metal-oxide electrode characterization and design assisted by surface analysis and computation • Understanding and tailoring of chemical expansion in solid electrodes • Protonic mixed-conducting electrodes 	Nakashima, Fujigaya, Gewirth, Sasaki, Lyth, Kilner, Tellez, Druce, Tuller, Perry, Matsumoto, Thoreton , Ghuman, Wu , Kwati
Project 2 Electrolytes	<p>Comprehension, control, and design of ionic conduction</p> <ul style="list-style-type: none"> • Highly durable polymer electrolytes with high conductivity and low crossover at low humidity and in wide temperature range. • Understanding electro-chemo-mechanical effects in metal oxides for enhanced ion conductivity and stability. • Study of proton-conduction in metal oxides for low-temperature solid electrolytes 	<ul style="list-style-type: none"> • High temperature, low humidity polymer electrolytes for PECs. • Novel low dimensional ionomers for PECs: nanoparticles, nanofibers and nanosheet membranes • Electro-chemo-mechanics for ionic and mixed conductors • Fundamental understanding of proton conduction in metal oxides to develop high conductivity proton conductors 	Fujigaya, Sasaki, Lyth, Nishihara, Kilner, Tellez, Druce, Tuller, Perry, Bishop, Matsumoto, Ertekin, Staykov, Thoreton , Ghuman, Wu , Kwati

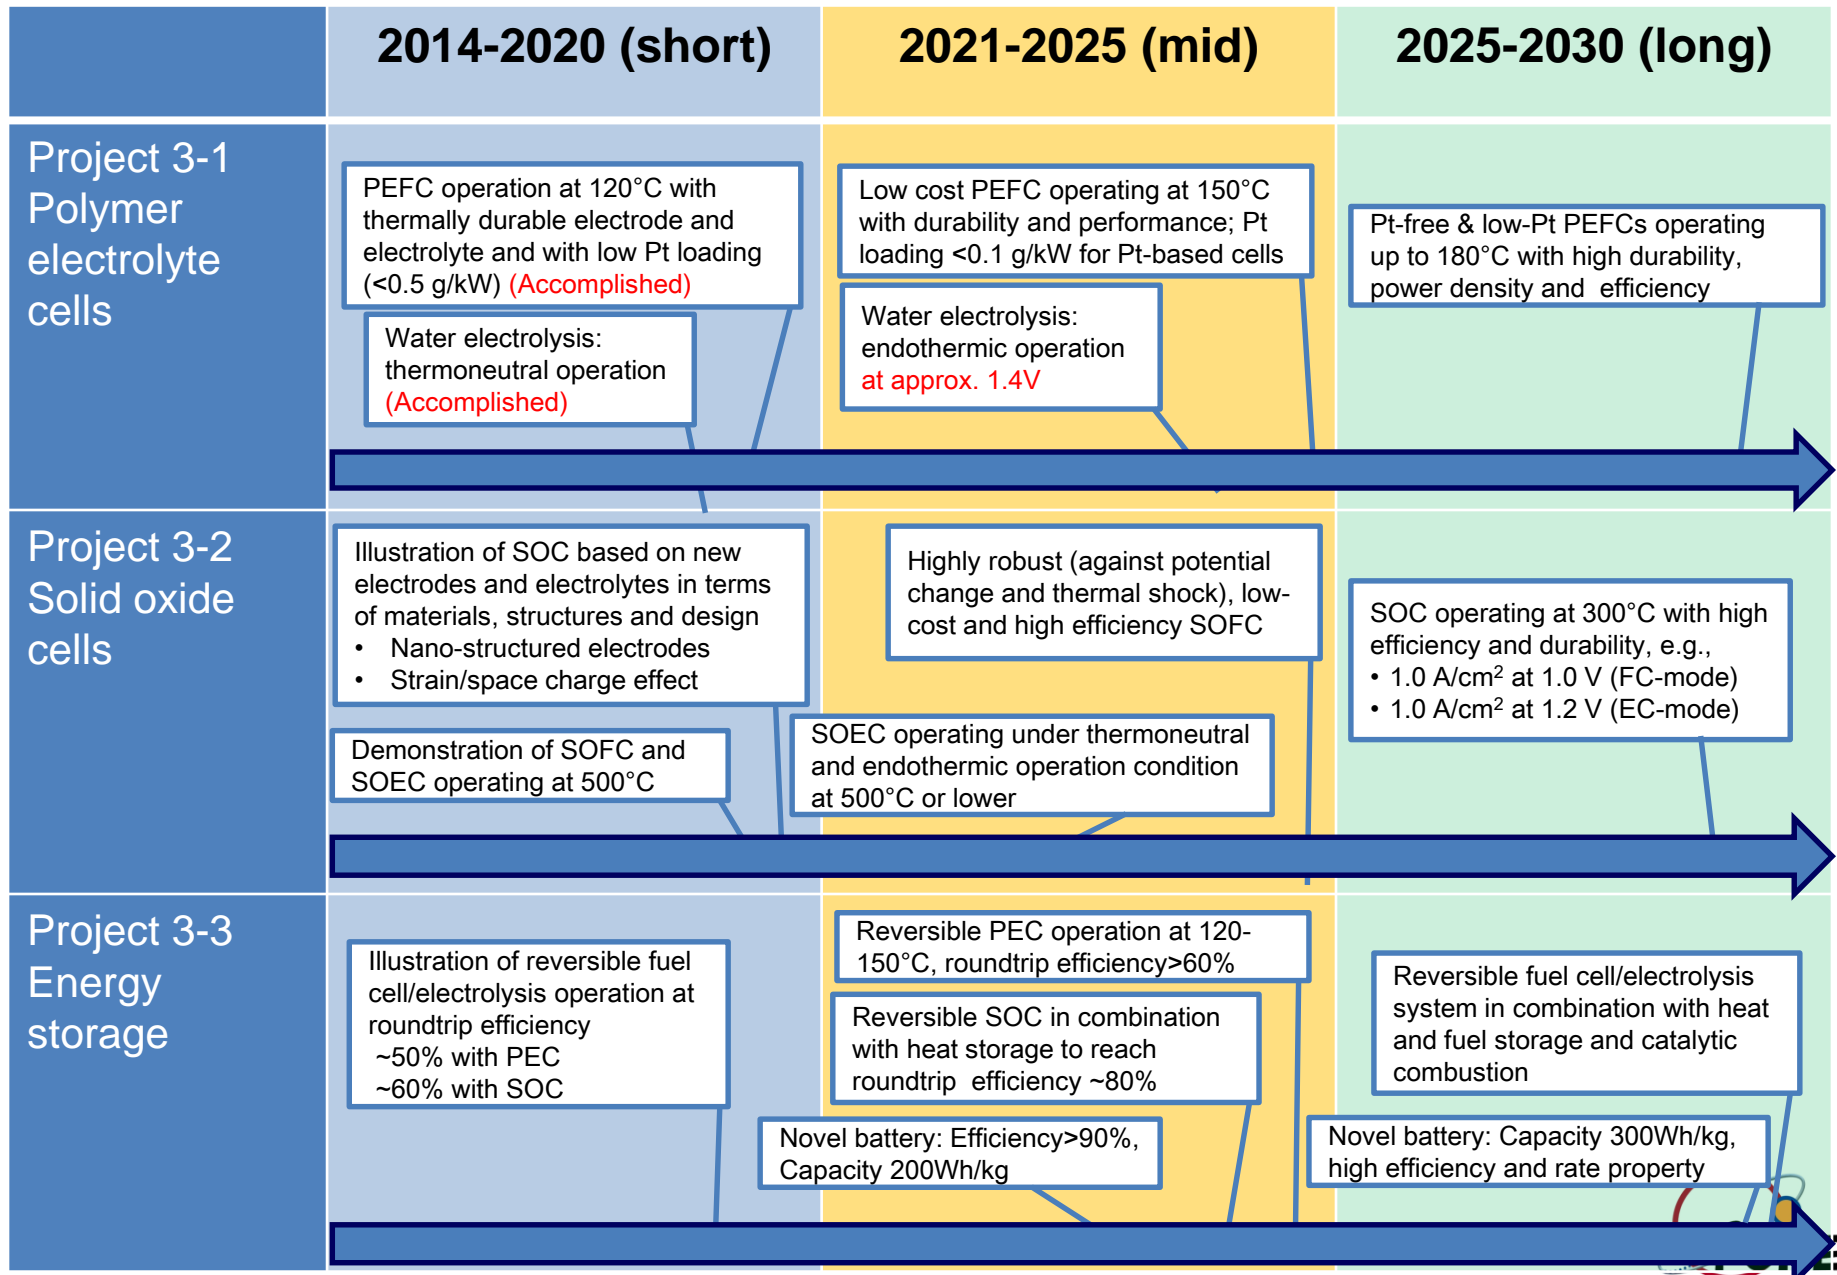

Division Projects, Objectives, and Research Efforts (2)

Projects	Objectives	Research Efforts	Researchers
Project 3-1 Polymer electrolyte cells	Fabrication and characterization of advanced PEFCs and PEECs <ul style="list-style-type: none"> • high durability, high efficiency • Wide temperature range • Low Pt loading / Pt-free 	<ul style="list-style-type: none"> • Highly durable PEFCs and PEECs based on advanced polymer-coated carbon electrocatalyst • Operation of Pt-based / Pt-free HT-PEFCs • Development of new cell architectures for water electrolysis and/or fuel cells using low-dimensional ionomer membranes 	Nakashima, Fujigaya, Lyth Matsumoto, Ito, Ghuman
Project 3-2 Solid oxide cells	Advanced SOFC <ul style="list-style-type: none"> • Based on newly tailored electrodes and electrolytes • Ultra high efficiency hydrogen-fueled SOFC Electrolysis of water and other chemical species <ul style="list-style-type: none"> • Thermally self-standing and endothermic operation of steam electrolysis • Material design and durability for oxidative and reducing environment 	<ul style="list-style-type: none"> • Next generation SOFC/SOEC utilizing the tailored electrodes and electrolytes for extreme efficiency operating at reduced temperatures • Hydrogen-fueled SOFC • Proton-conductor-based SOEC • Oxide-ion-conductor-based SOEC 	Matsumoto, Tuller Perry, Kilner Druce, Tellez, Ishihara, Kwati
Project 3-3 Energy storage	<ul style="list-style-type: none"> • High capacity new concept batteries • PEFC/PEEC and SOFC/SOEC • Sufficient round-trip efficiency 	<ul style="list-style-type: none"> • Dual carbon battery • Fe-air battery • SOFC/SOEC reversible cells and systems • PEFC/PEEC reversible cells and systems 	Ishihara, Kilner, Druce, Tellez, Matsumoto, Nakashima, Gewirth Fujigaya, Ito

Milestones (1)

Milestones (2)

Ultimate targets

Current Benchmarks

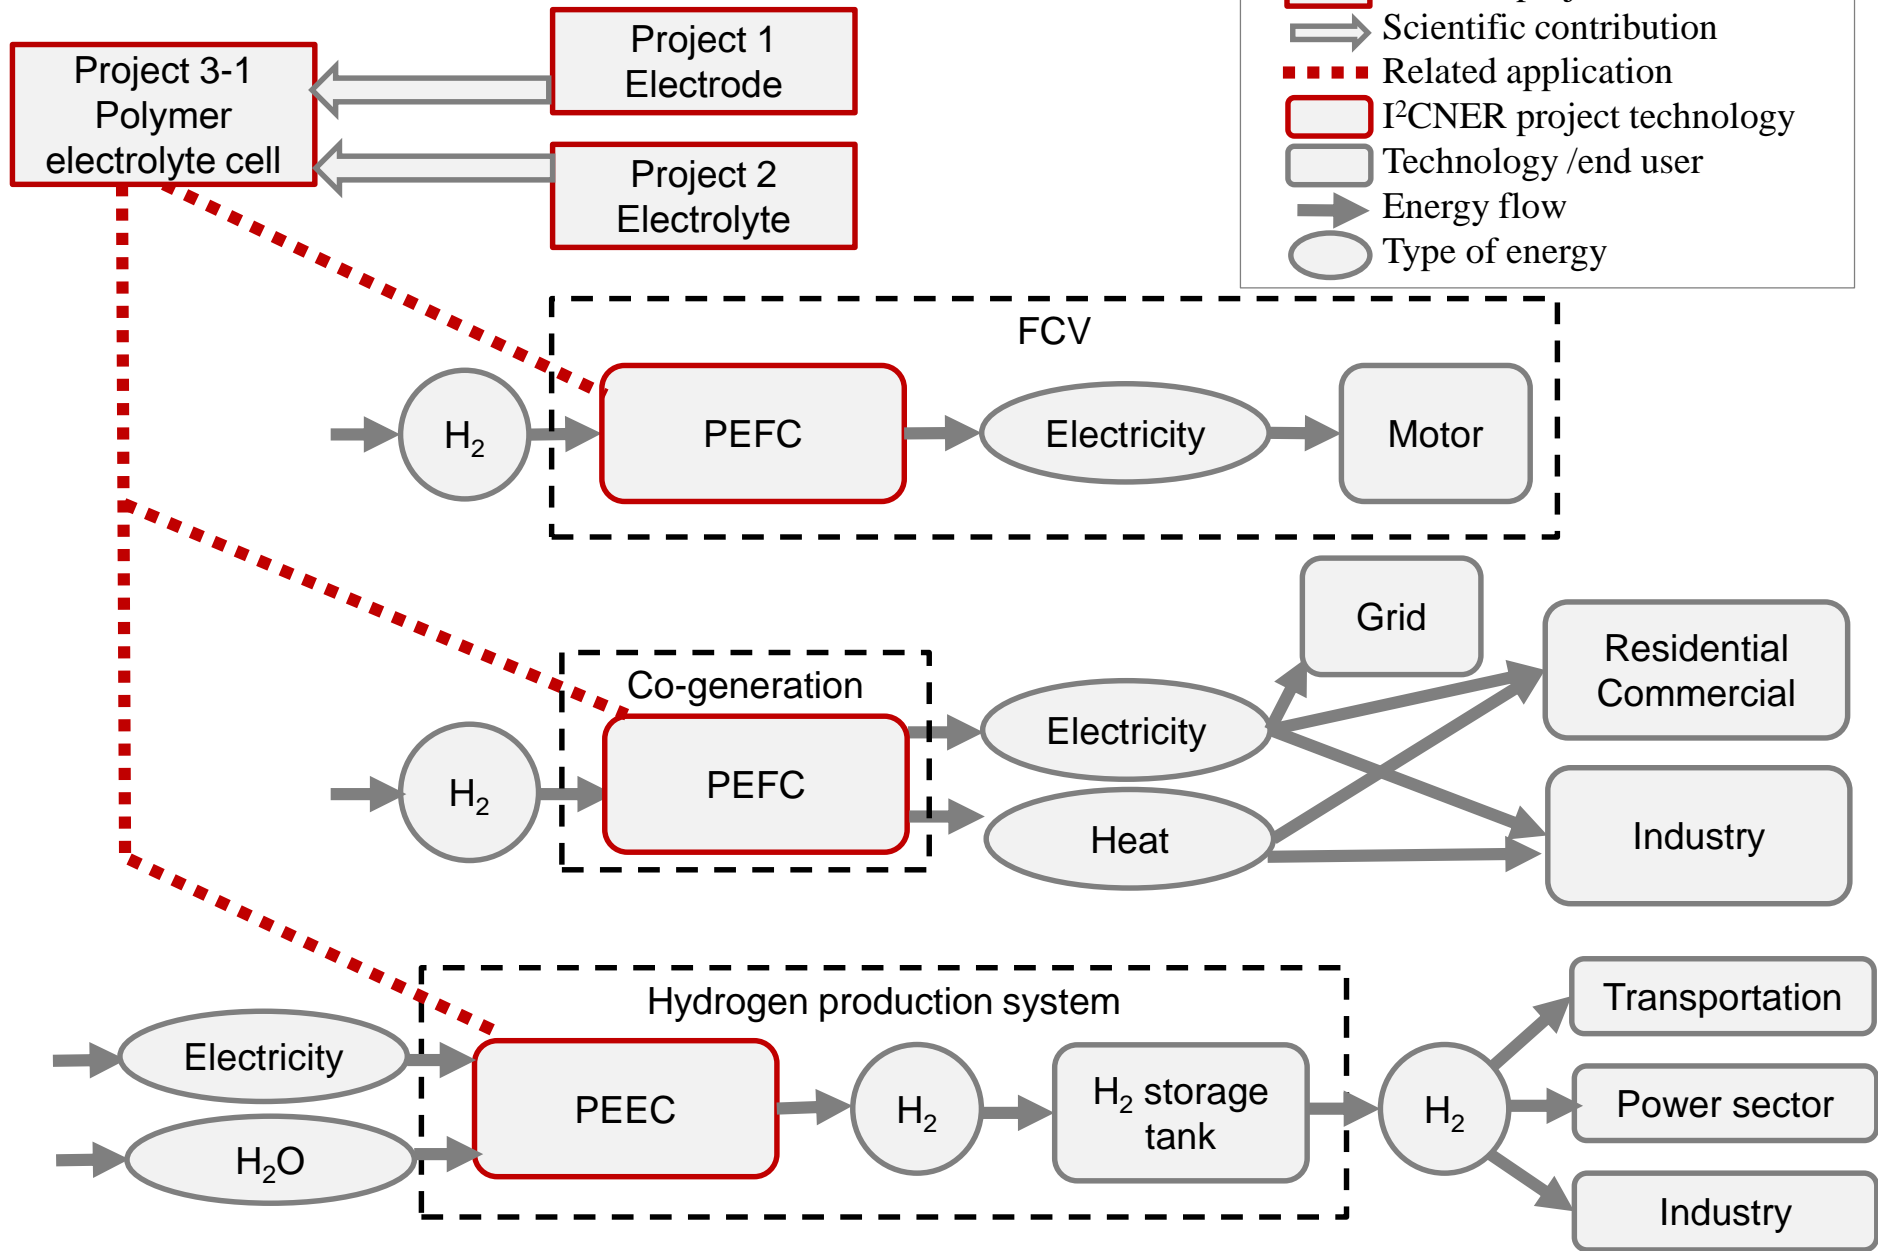

Technology/Application

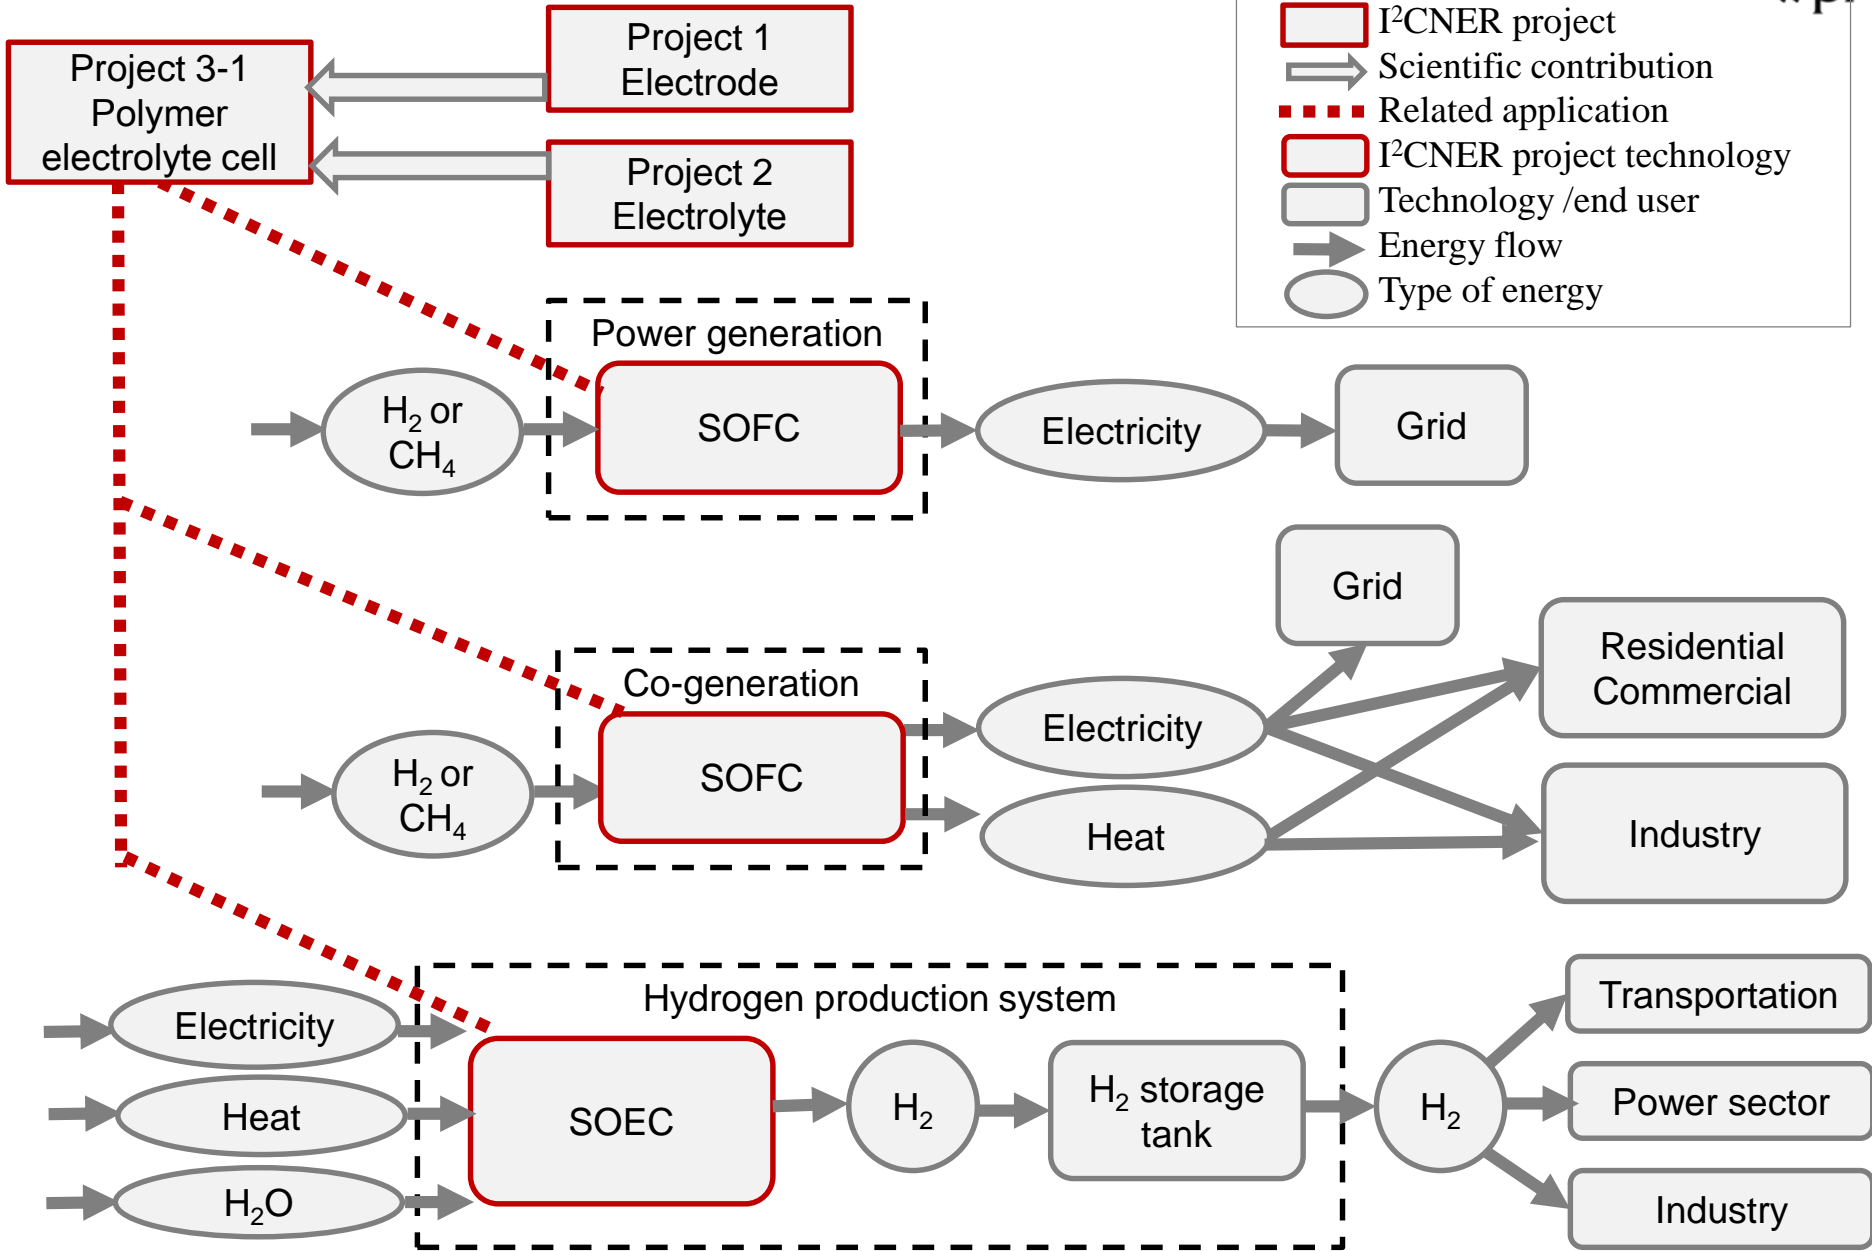

<p>Project 1 Electrode</p>	<p>For PECs</p> <ul style="list-style-type: none"> Stable electrode for 100,000 potential cycles in temperature range 0-180°C Pt-free electrocatalyst having comparable catalytic activity to precious-metal-based catalyst <p>For SOCs</p> <ul style="list-style-type: none"> Stable and durable solid oxide electrode material with $D^*k > 10^{-14} \text{ cm}^3 \text{ s}^{-2}$ at 500°C, with acceptable stability Chemical expansion coefficient < 0.01 Comprehensive atomistic understanding of electrode processes in relevant solid oxide materials 	<p>ECSA degradation below 10% under FCCJ condition after 10,000 cycles..</p> <p>$D^*k = 10^{-19} \text{ cm}^3 \text{ s}^{-2}$ (LSCF, 500°C)</p> <p>Little theoretical work on technologically relevant materials</p>	<p>Contribute to Project 3-1, 3-2 and 3-3</p>
<p>Project 2 Electrolyte</p>	<p>Polymer electrolytes</p> <ul style="list-style-type: none"> Conductivity comparable to Nafion ($> 0.05 \text{ S/cm}$), low cost ($< 40 \text{ USD/m}^2$) and stable operation up to 180°C for 10,000 hours <p>Solid oxide electrolytes</p> <ul style="list-style-type: none"> Cross-plane ionic conductivity $> 0.01 \text{ S/cm}$ at 300°C (protons) or 500°C (oxide ions) with ionic transport number > 0.99 	<p>Nafion: 0.1 S/cm Nafion: 1400 USD/m² Nafion: 90°C; PBI: 180°C; AGC 100°C, Aquivion 120°C</p> <p>0.05 S/cm at 500°C ($\text{Bi}_2\text{V}_{1.9}\text{Cu}_{0.1}\text{O}_{5.35}$) 0.016 S/cm at 500°C (GDC) 0.006 S/cm at 500°C (LSGM) 0.01 S/cm at 500°C (BaCe_{0.36}Zr_{0.44}Y_{0.20}O_{3-δ})</p>	<p>Contribute to Project 3-1, 3-2 and 3-3</p>

Ultimate targets		Current Benchmarks	Technology/Application
Project 3-1 Polymer electrolyte cell	PEFC <ul style="list-style-type: none"> Operation temperature: 0-180°C Electrode: low Pt-loading (< 0.1 mg/cm²) or Pt-free Non-humidifying operation Water electrolysis <ul style="list-style-type: none"> Cell voltage: 1.5 V@1 A cm⁻² (thermo-neutral) 	Nafion: 0-90°C, PBI: 80-180°C, AGC 0-100°C, 0.1 g/kW (DOE Target 0.125) non-humidifying operation below 80°C Cell voltage: 1.7 V@2 A/cm ² , J. Xu et al., 2012	<ul style="list-style-type: none"> PEFC for automobile, PEFC co-generation Water electrolysis (PEEC)
Project 3-2 Solid oxide cell	<ul style="list-style-type: none"> Operation temperature: 300-500°C Durability: 0.5% @ 1000hrs. SOEC: > 1 A cm⁻² under thermo-neutral operation (~1.3 V, Energy Efficiency (LHV) = 100%) SOFC: 1-5 W/cm² 	SOEC: 1 A cm ⁻² (@800°C) with 2% / 1000h degradation – Sun et al. (DTU, Denmark)	<ul style="list-style-type: none"> SOFC co-generation (H₂, CH₄) SOFC mono-generation (H₂, CH₄), SOFC mono-generation(CH₄) + CCS Steam Electrolysis (SOEC)
Project 3-3 Energy storage	New battery: <ul style="list-style-type: none"> Overall Energy Efficiency >90%, Capacity: 300 Wh/kg Rate Property: 70% discharge capacity @ 10C FC-EC reversible energy storage <ul style="list-style-type: none"> SOFC/SOEC roundtrip efficiency >75% at 500°C >85% at 500°C with heat storage PEFC/PEEC roundtrip efficiency >60% Degradation less than 0.5%/1000 h under reversible operation at 500°C with electrolysis current 1 A cm⁻² at thermo-neutral voltage (1.3 V) 	88% (Li ion battery) Capacity 200 Wh/kg Rate Property, 50% @5C Roundtrip efficiency >70% at 680°C (SOC) Roundtrip efficiency 42% (PEC) 4000h reversible operation at 800°C; 1 A/cm ² @ 1.33 V in SOEC mode, 0.5 A/cm ² in SOFC mode for 4000h	<ul style="list-style-type: none"> Energy storage (new battery)

Role & Contribution through Technology

- The role of this division toward CNS is to create:
 1. fuel cells (a key device of hydrogen energy systems) for automobiles, co-generation systems, and mono-generation systems to use **hydrogen and methane efficiently**
 2. electrolysis (a key device of the hydrogen energy system) for hydrogen production to use and store renewable energy efficiently, contributing to providing cheap **low carbon hydrogen**
 3. energy storage system to **accommodate intermittent renewable energy**

Technology/Application (3)
